## Introduction to installing Cloudy

This page contains step by step instructions for installing the current stable version of Cloudy. *Hazy*, the code's documentation, the download.

Each version of the code has a set of pages giving updates. The [HotFixes](#) page lists corrections that need to be made to the do source. These are bug fixes that were not included in the version of the code available for download and used to generate the c the test suite. So the hot fixes should be applied after the test suite has been run and your system validated. A [KnownProblem](#) known problems with that version of the code. The [RevisionHistory](#) page lists improvements.

Cite the code by giving the version number and a reference to the last major review of Cloudy, Ferland et al. (1998; PASP, 110 available [↪ here](#)). An example would be "We used version 05.07b of Cloudy, last described by Ferland et al. (1998)". Then, ye when someone wants to know how an answer was obtained, the version used to obtain it can be retrieved from the old version web site. The **print citation** command will print the correct citation for the version you are using.

## Setting up this version

1. [Download](#) the code, data, and documentation. This creates several directories, Each contains a readme.htm file describing t that directory.
2. [EditPath](#) - instructions for how to specify where the data files are located. **Important!** The code will not run if it cannot find
3. [CompileCode](#) - how to compile the code using a variety of compilers.
4. [RunCode](#) - This explains how to execute the code and run a smoke test.
5. [MpiParallel](#) describes how to use the optimize and grid commands on a parallel cluster, using either MPI or a makefile.
6. [CompileStars](#) - You must compile some stellar data files if you want to use the some of the table star command to include re continua.
7. [TestSuite](#) is a large number of test cases that you should run to confirm that all is well. This is a critical step since it will che your compiler. That directory also contains a group of programs that show how to call the code as a subroutine.
